

1946-1947 美國發起了「跳高行動」

1946-1947: Operation Highjump

1940-1950 科研基地建立

1940-1950: The Rise of Research Bases

南極地區的科研活動從戰前的探險轉向了永久性基地的建設，這與二戰後的政治與地緣戰略密切相關。

During this decade, activities in Antarctica shifted from temporary expeditions to the construction of permanent research bases. This transition was closely linked to the political and geopolitical strategies that emerged after World War II.

1959 簽署《南極條約》

1959: The Antarctic Treaty

《南極條約》規範南極僅限和平與科學用途，禁止任何開發，且觀測資料須共享。目前共有56國簽署，保護這片土地成為跨國科研與資源保護的全球淨土。

Signed in 1959, the Antarctic Treaty reserves the continent exclusively for peaceful and scientific purposes, banning all industrial development. It mandates that all scientific data must be shared among nations. Today, with 56 member countries, the treaty protects this land as a global sanctuary for international research and environmental conservation.

1957-1958 國際地球物理年（IGY）

1957-1958: The International Geophysical Year (IGY)

1957年開啟的IGY促成跨國科學協作，科學家透過觀測極地與外太空，不僅發現了范艾倫輻射帶，更繪製洋中脊，為板塊構造學說奠定重要基礎。

The IGY sparked a new era of global scientific cooperation. By studying the Earth's poles and outer space, scientists discovered the Van Allen radiation belts and mapped the mid-ocean ridges. These breakthroughs provided the vital evidence needed to develop the theory of plate tectonics.

1960後—現代科學考察

1960s-Present: The Era of Modern Science

極地科學考察進入了以國際合作、現代技術和系統性環境監測為核心的全新階段，從早期的「地理發現」正式轉向深入的「科學研究」，重點在於理解氣候變化、冰川學、生物學及海洋學。

Since the 1960s, polar exploration has evolved from early "geographic discovery" into a new era of systematic scientific research. Today, international cooperation and advanced technology are at the heart of our mission; scientists now focus on long-term environmental monitoring to better understand climate change, glaciology, biology, and oceanography.
